Programming Project 9

Assume that a file named `golf.txt` exists in the current working directory. The file contains the names of golfers and their final scores in a tournament. The file is structured so there is a line with the golfer's name followed by their score on the next line. Here is an example of the file's contents:

```
Luka
72
Mateo
76
Marissa
74
Rohan
78
```

Write a program that reads the `golf.txt` file and prints each golfer's name and score.

Answer

```python
with open('golf.txt', 'r') as file:
    name = True
    for line in file:
        if name:
            print(f'Name:{line}', end='')
        else:
            print(f'Score:{line}')
        name = not name
```
